

12.6 - Quadratic Surfaces

Graphing more complicated curves/surfaces

Will formalize a technique we have already briefly seen.

A **trace** is the intersection of a surface and a plane parallel to one of coordinate planes.

Think of them like slices of the surface. Give us hints of what surface looks like.

Ex:

$$\underline{x^2 + y^2 = 4}$$

First, restrict ourselves to $\boxed{z=C}$

$$y - x = \infty$$

This gives us a cylinder. But cylinder is actually general term for all parallel lines that pass through a plane (2-D) curve

Ex:

$$\frac{x^2}{2} + \frac{z^2}{8} = 8$$

$$\frac{z^2}{8} = 8$$

$$z^2 = 64$$

$$z = \pm 8$$

Quadratic Surfaces

Fancy name, don't be intimidated.

Have equation in x, y, z and at least one of those is squared.

Ex:

$$x^2 + y^2 + z^2 = 1$$

$$x^2 + y^2 + 3z = 0$$

$$-x + y + 2z^2 = 4$$

etc.

Call the graphs of this type of equation a quadratic surface.

Don't need to know properties, just how to graph them.

Use traces!

Graphing Steps

Given an equation: ★

- ① Pick a direction to take traces (slices)

Ex: along z -axis

- ② Pick a value along that axis, plug it into equation to get trace

Ex: choose $z = 3$. Plug 3 in for z in equation. Graph that 2-D curve in plane $z = 3$.

- ③ Repeat for more along same axis.

- ④ Do same for other two axes.

- ⑤ Connect the traces.

Ex:

$$y = 2x^2 + \underline{z^2}$$

- ① $z = 0$
- ② $\boxed{z=0}$
 $\boxed{y=2x^2}$
- ③ $z=1$ plane
 $y=2x^2+1$
- $z=2$ plane
 $y=2x^2+4$

$$y = 2x^2 + z^2$$

$$\begin{cases} y=0 \\ 0 = 2x^2 + z^2 \end{cases}$$

$$\begin{cases} y=-1 \\ -1 = 2x^2 + z^2 \end{cases}$$

$$\begin{cases} y=2 \\ 2 = 2x^2 + z^2 \end{cases}$$

$$\begin{cases} y=4 \\ 4 = 2x^2 + z^2 \end{cases}$$

$$y = 2x^2 + z^2$$

$$\begin{cases} A=0 \\ y=z^2 \end{cases}$$

Need to be able to sketch

- Lines
- Circles
- Ellipses
- Parabolas
- Hyperbolas

Ex:

$$y = x^2 - z^2$$

$$y = 0$$

$$0 = x^2 - z^2$$

$$x^2 = z^2$$

$$|x| = |z|$$

$$y = -1$$

$$-1 = x^2 - z^2$$

$$1 = z^2 - x^2$$

$$y = x^2 - z^2$$

$$x = 0$$

$$y = -z^2$$

$$x = 1$$

$$y = 1 - z^2$$

$$y = -z^2 + 1$$

$$y = x^2 - z^2$$

$$z = 0$$

$$y = x^2$$

$$z = 1$$

$$y = x^2 - 1$$
